(a) one line per page: four placements
ns per dependent load
lines in the cycle (= distinct 16 KiB pages for paged layouts)
original layout (offset = index mod 128) (n=12)
random in-page offsets (n=12)
constant in-page offset (n=12)
packed contiguous (same lines) (n=12)
(b) separating translation from set conflicts
latency difference (ns, symlog)
distinct pages touched
translation penalty: random offsets minus packed
set-conflict penalty: constant minus random offsets
original layout minus random offsets
256 pg
2048 pg
16384 pg
(c) fixed cache footprint, vary pages
ns per dependent load
distinct pages P holding the same 32768 lines (4 MiB)
original layout (offset = index mod 128)
random in-page offsets
constant in-page offset
no PMU data in this dataset
